Description

FIELD OF THE INVENTION

The present invention relates to novel 2-substituted-4-substituted-1,3 dioxolanes which are useful as antiviral agents.

PRIOR ART

Retroviral infections are a serious cause of disease and among others the acquired immunodeficiency syndrome (AIDS) is an immunosuppressive disease associated with life-threatening opportunistic infections and high susceptibility to unusual neoplasms (Kaposi sarcoma for instance). The human immunodeficiency virus (HIV) has been recognized as the etiologic agent of AIDS and compounds having an inhibitory effect against HIV multiplication have been actively sought.

One product which has been proposed for the treatment of AIDS is the 3'-azido-2',3'-dideoxythymidine commonly referred to as AZT. The activity of this compound was disclosed by MITSUYA et al. in Proc. Natl. Acad. Sci., U.S.A. 1985, 82, 7099. The compound has the structure:

This compound is useful in protecting AIDS carriers against the cytopathogenic effect of the human immunodeficiency virus (HIV) which is the etiologic agent of AIDS.

Mitsuya et al. have also disclosed in Proc. Natl. Acad. Sci., U.S.A. 1986, 88, 1911 a group of 2',3'-dideoxynucleosides which appear to possess potent protective activity against HIV-induced cytopathogenicity. A typical such compound is the 2',3'-dideoxycytidine of the formula:

Balzarini et al. in Biochem. Biophys. Res. Comm. 1986, 140, 735 disclose that the unsaturated analog of the 2',3'-dideoxycytidine also possesses antiretroviral effectiveness. This unsaturated analog has the formula:

Baba et al. in *Biochem. Biophys. Res. Comm.* 1987, **142**, 125 have described the 2',3'-unsaturated analog of the 2',3'-dideoxythymidine which is a potent selective inhibitor of HIV replication and which corresponds to the formula:

Analogues of the 3'-azido-2',3'-dideoxythymidine are the 3'-azido-2',3'-dideoxyuridine of the formula:

where y is bromine or iodine. These have been disclosed as having an inhibitory activity against Moloney murine leukemia by T.S. Lin et al., in *J. Med. Chem.* 1987, **30**, 440.

Finally, the 3'-fluoro analogues of the 2',3'-dideoxycytidine and of the 2',3'-dideoxythymidine have been disclosed by Herdewijn et al. in *J. Med. Chem.* 1987, **30**, 1270 as having potent antiretroviral activity (anti-HIV). These analogues correspond to the formulae:

The most potent anti-HIV compounds thus far reported are 2,3'-dideoxynucleosides, more particularly, 2,3'-dideoxycytidine (ddCyd) and 3'-azido-2,3'-dideoxythymidine (AZT). These compounds are also active against other kinds of retroviruses (such as the Moloney murine leukemia virus). It is because of the increasing incidence and the life-threatening characteristics of AIDS that efforts are being expended to discover and develop new non-toxic and potent inhibitors of HIV and blockers of its infectivity.

It is therefore an object of the present invention to provide effective anti-HIV compounds of low toxicity and a synthesis of such new compounds that is readily feasible.

SUMMARY OF THE INVENTION

In accordance with the present invention there are provided novel 2-substituted-4-substituted-1,3-dioxolanes which are particularly useful as antiviral agents.

More specifically, the novel 2-substituted-4-substituted-1,3-dioxolane derivatives of the present invention correspond to the following formula (L):

wherein R_1 is selected from the group consisting of hydrogen, an acyl group having 1 to 16 carbon atoms, benzoyl and a benzoyl substituted in any position by at least one halogen, $C_1 - C_3$ alkyl, $C_1 - C_3$ alkoxy, nitro and trifluoromethyl groups; R_2 is a heterocyclic radical selected from:

wherein R_2 and R_4 are independently selected from the group consisting of hydrogen and $C_1 - C_3$ alkyl and R_5 is selected from the group consisting of $C_1 - C_3$ alkyl and halogen.

Also within the scope of the present invention are the 2,4-disubstituted-1,3-dioxolanes of Formula (L) wherein R_2 could be any nucleoside base analog, those base analogs being known by those of skill in the art of nucleoside chemistry.

There are two asymmetric carbons (asterisks) in the disubstituted 1,3-dioxolane molecule which provide for two racemic forms (\pm) and therefore four optical isomers. These racemates differ in the relative configurations of the 2- and 4-substituents which can either assume the *cis*- and *trans*-configurations. The use of a graphic representation of the 2,4-disubstituted-1,3-dioxolanes of Formula (L) is meant to include the *dl* racemic mixture as well as the separate *d* and *l* isomers thereof.

Also in accordance with the present invention, there is provided a pharmaceutical composition for administration to persons infected with the AIDS virus or other infectious agent which comprises a therapeutically effective amount of the 2,4-disubstituted dioxolane of Formula (L) or pharmaceutically acceptable salt in association with a pharmaceutically acceptable excipient. The amount of active ingredient which is contained in a single dosage form will vary depending upon the host treated as well as the frequency and the mode of administration.

Also within the scope of the present invention is a method for treating AIDS-infected persons which comprises administering to said persons a therapeutically effective amount of 2,4-disubstituted-1,3-dioxolane of Formula (L). Also within the scope of the present invention is any combination of a 2,4-disubstituted-1,3-dioxolane of Formula (L) with another drug where such combination is therapeutically more advantageous than either drug given above.

DETAILED DESCRIPTION OF THE INVENTION

The compounds of the invention are prepared starting from glycerol and 2-halo- (or an equivalent leaving group such as aryl- or alkyl-sulfonyloxy) acetaldehyde preferably in the form of an acetal derivative according to the reported procedure of E.G. Hallonquist and H. Hibbert, Can. J. Res. 1933, 7, 129. For the purpose of this disclosure, the term acyl is an alkanoyl radical of 2 to 16 carbon atoms, e.g., acetyl, propionyl, isobutyryl, myristoyl, etc. The compounds of the instant invention are prepared by a total synthesis comprising a few steps. The synthesis is practical and is commercially feasible. The process for preparing one specific compound of the present invention is outlined in the following Flowsheet 1:

Flowsheet 1

The various steps involved in the synthesis illustrated in Flowsheet 1 may be briefly described as follows:

Step 1 The primary alcohol function of the starting dioxolane I is treated with an oxidizing reagent such as chromic acid (which may be complexed with pyridine) in a compatible organic solvent to give the corresponding dioxolane carboxylic acid II.

Step 2 The acid II is converted to a mixed anhydride using an alkyl chloroformate and submitted to a Bayer-Villiger oxidation with an organic peracid such as m-chloroperbenzoic acid to yield the corresponding aryloxydioxolane III.

Step 3 Intermediate III is then reacted with thymine previously silylated with hexamethyldisilazane in a compatible solvent and the reaction catalyzed by a Lewis acid or preferably by trimethylsilyltriflate to give the thymine-1'-yl dioxolane IV.

Step 4 The chlorine atom of IV is displaced by reaction with a benzoic acid salt in a compatible solvent such as dimethylformamide to give intermediate V.

Step 5 The benzoate ester function is then hydrolyzed under basic conditions to yield the desired end-product VI.

An alternate process for preparing further specific compounds of the present invention is illustrated in Flowsheet II:

Flowsheet II (Continued)

The various steps involved in the synthesis illustrated in Flowsheet II may be briefly described as follows:

Step 1 The chlorine atom of starting dioxolane I is displaced by a benzoic (or acetic) acid salt in a solvent such as dimethylformamide to yield the diol monoester VII.

Step 2 The hydroxymethyl group of VII is oxidized with a suitable reagent such as chromic acid (which may be complexed with pyridine) in a compatible organic solvent to give the dioxolane carboxylic acid VIII.

Step 3 The acid VIII is then submitted to Bayer-Villiger oxidation by the procedure outlined in Step 2 (Flowsheet I) above to give the corresponding aryloxy-dioxolane IX.

Step 4 The key intermediate IX is reacted with cytosine previously silylated under the reaction conditions outlined in Step 3 (Flowsheet 1) to give the cytosine-1'-yl dioxolane X.

Step 5 The amino function of X is acylated with acetic anhydride in pyridine to give XI which provides for easier separation of isomers.

Step 6 The ester and acetyl functions of XI are hydrolyzed under basic conditions to yield the desired end-product XII.

Step 7 (IX to XIII) Key intermediate IX is reacted with adenine by the procedure outlined above in Step 3 (Flowsheet 1) to give XIII.

Step 8 (XIII to XIV) The ester function of XIII is hydrolyzed under basic conditions to yield the desired end-product XIV.

Step 9 (IX to XV) Intermediate IX is reacted with 2-amino-6-chloropurine under the conditions outlined in Step 3 (Flowsheet 1) to give compound XV.

Step 10 (XV to XVI) The preceding intermediate is hydrolyzed under basic conditions to yield the desired end-product XVI.

Step 11 (XVI to XVII) The chlorine atom of XVI is removed by catalytic hydrogenation over Pd/C to give the 2'-amino-purin-9'-yl dioxolane XVII.

Step 12 The above intermediate XV is reacted with excess ammonia under pressure whereupon the 2',6'-diamino-purin-9'-yl dioxolane XVIII is generated.

Step 13 Compound XVI is submitted to boiling sodium hydroxide to give the desired end-product guanine-9'-yl dioxolane XIX.

ANTIVIRAL ACTIVITY

All of the compounds of the preferred embodiments are novel and some are valuable for their properties as non-toxic inhibitors of the primary replication of HIV-1 in previously uninfected T-lymphocytes over a prolonged period of time.

In particular, the compounds having the formula XII possess desirable properties, i.e., antagonism of HIV infectivity towards T-lymphocytes in the absence of cytotoxicity.

In vitro testing was conducted on the compounds to determine their inhibitory properties. Table 1 represents the results of a typical experiment. The figures reported are the micromolar concentrations in the incubation media which effect the ability of T-lymphocyte H-9 cells to be infected by HIV-1 following the protocol of H. Mitsuya and S. Broder, Proc. Natl. Acad. Sci. U.S.A. 1986, 83, 1911-1915; the level of infection being measured by the level of reverse transcriptase activity (RTA) as assayed in the usual manner with tritiated thymidine triphosphate (TTP). As a control drug, 2',3'-dideoxy-3'-azido-thymidine (AZT) was used and the RTA measured in the incubation medium after 8, 12 and 26 days of exposure to the inhibitor. The values in Table 1 reflect the total number of virus particles in the incubation medium.

Table 1

Example of the effects of prototype compounds <u>trans</u> -XII, <u>cis</u> -XIV and AZT on ability of H-9 cells to be infected by HIV-1.					
Expt.#	Inhibitor	Conc.-	RTA activity (cpm) after:		
			8 days	12 days	26 days
1	none	-	198,612	327,570	239,019
	<u>trans</u> -XII	10 μ M	4,608	83,462	312,478
	<u>trans</u> -XII	50 μ M	1,319	758	1,732
	AZT	20 μ M	633	419	821
2	none	-	64,789	119,580	227,471
	<u>cis</u> -XIV	20 μ M	2,618	130,583	210,583
	<u>cis</u> -XIV	50 μ M	1,132	39,752	231,609
	AZT	20 μ M	587	1,318	679

It is apparent from the table that prototype compound trans-XII exhibits potent inhibitory activity. Other analogues displayed variable degrees of antiviral activity. Accordingly, as it is the rule for certain analogues of nucleosides, trans-XII and selected analogues are expected to demonstrate in vivo activity as inhibitors of

retroviruses. Such compounds may also be used in combination with other antiviral agents at reduced doses, thus lowering their toxicity potential.

TOXICITY

In contrast to the results obtained with AZT or with other di-deoxynucleosides analogues, *in vitro* toxicity experiments showed that the compound *trans*-XII is non toxic even at concentration as high as 200 μ M. In spite of the AZT activity, its serious bone marrow toxicity limits its therapeutic usefulness. It is then highly desirable to provide with new active antiviral agents which would be devoided of toxic side effects.
